Steps of Installing the Small Hole Biopore Based Artificial Recharge (bio_bar)

Select location where overland flow tends to converge, or dig a furrow to direct overland flow into the hole.

Drill a pit hole at the bottom of furrow using “biopori” auger up to maximum 100 cm depth or above water table if water table is shallow.

When necessary, plug the most upper part of the hole with a hollow protection cap.
Soon, fill up the hole with solid organic waste.
