Add auto increment column in PostgreSQL

In PostgreSQL, we cannot just add a column and mark it as auto increment like in MySQL or SQL Server. Instead, we have to create a sequence and link it to the specified column.

1. Assume that we have a table called [testtbl] with an unique column called [id]

2. Generate sequence

```
1
CREATE
SEQUENCE
<Sequence name>
```

=>

```
1
CREATE
SEQUENCE
<testtbl_id_seq>
```

※After the sequence’s already created, we can call NEXTVAL(‘<Sequence name>’) to generate a new value automatically.
3. Link the sequence to the unique column

```
ALTER TABLE <Table name>
ALTER COLUMN <Column name>
SET DEFAULT NEXTVAL(<Created sequence name>);
```
That's all what we have to do.
